## What is Claimed is:

- 1 1. A high strength detachable cylinder-to-plate joint comprising:
- a connecting disk detachably attached to a base plate;
- a cylinder having an annular end with an abutment surface; and
- a threaded connection for detachably attaching the annular end
- to the connecting disk so that the abutment surface abuts the
- 6 base plate.
- The joint of claim 1, wherein the base plate comprises a table top and the cylinder comprises a table leg.
- The joint of claim 1, wherein the cylinder has first and second annular ends each threadably connected to corresponding connecting disks for forming a detachable joint between first and second plates.
- The joint of claim 3, wherein the cylinder first and second annular ends are threaded in reverse direction to each other and mate with reverse threaded plates such that connection between the two plates can be made tight by turning the cylinder in only one direction of rotation.
- The joint of claim 1, wherein the annular end comprises a sleeve having first and second ends wherein the first end threadably receives the connecting disk and the second end receives the cylinder.
- The joint of claims 5, wherein the second end is threadably attached to the cylinder.
- The joint of claim 5, wherein the second end of the sleeve has tapered walls mated to a corresponding tapered diameter end of the cylinder.

- The joint of claim 7, wherein the sleeve includes one or more attachment bolts screwed into the tapered diameter end of the cylinder.
- The joint of claim 8, wherein the sleeve includes an integrally formed disk for receiving the attaching bolts.
- 1 10. The joint of claim 8, wherein the sleeve includes a second threadably connected disk for receiving the attaching bolts.
- 1 11. The joint of claim 1, wherein the plate is bolted between the connecting disk and a second disk having a threaded outer diameter.
- 1 12. The joint of claim 11, wherein the second disk is detachably attached to an annular end of a second cylinder to form a combination joint.
- 1 13. The joint of claim 1, wherein the connecting disk is attached by spring loaded bolts.
- 1 14. The joint of claim 1, including a gasket between the base plate 2 and the cylinder abutment surface.
- 1 15. The joint of claim 5, wherein the sleeve has a variable diameter.
- 1 16. The joint of claim 1, including pins for limiting rotation of the connecting disk.
- 1 17. A shelving system comprising successive shelves stacked using multiple joints in accordance with claim 12.
- 1 18. Furniture comprising multiple joints in accordance with claim 3.
- 1 19. The joint of claim 5, wherein the sleeve comprises a square stock having a cylindrical hole.

- The joint of claim 5, wherein the sleeve is enclosed by a veneer sheath comprising a material matching or complimenting the
- composition of the extension device in the sleeve or plate.
